EXIT ACCESS STAIRWAYS AND RAMPS (PER IBC 1019)
A Shaft enclosure not required per 1019.3.4 where: Exit access stairways and ramps in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the stairway or ramp and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13.

INTERIOR EXIT STAIRWAYS AND RAMPS (PER IBC SECTION 1023)
A Exit stairway enclosures shall be fire barriers per IBC Section 707 and/or horizontal assemblies per IBC Section 711.

3 Not less than 1 hour where connecting less than 4 stories.
Number of stories connected by the stairway enclosure shall include any basements.
B Interior exit stairways and ramps serving as and exit component in means of egress shall lead directly to the exterior of the building or shall be extended to the exterior with an exit passageway, except as permitted in IBC Section 1027.1.
IBC Section 1027.1 Exceptions1 and 2 shall not exceed 50 percent of the number and capacity of the required exits.
1 Maximum of 50 percent of the number and capacity of interior exit stairways and ramps is permitted to egress through areas on the level of exit discharge provided all of the following are met:
1.1 Such enclosures egress to a free and unobstructed path of travel to and exterior exit door and such exit is readily visible and identifiable from the point of termination of the enclosure.
1.2 The entire area of the level of exit discharge is separate from areas below by construction conforming to the fire-resistance rating for the enclosure.
1.3 The egress path from the interior exit stairway and ramp on the level of exit discharge is protected throughout by an approved automatic sprinkler system.
2 A maximum of 50 percent of the number and capacity of the interior exit stairways and ramps is permitted to egress through a vestibule provided all of the following are met:
2.1 The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the enclosure.
2.2 The depth from the exterior of the building is not greater than 10 feet and the length is not greater than 30 feet.
2.3 The area is separated from the remainder of the level of exit discharge by construction providing protection at least the equivalent of approved wired glass in steel frames.

1. **Steel Column, Steel Pipe or Steel Tube —** Wide flange steel column (W), or steel circular pipe (SP) or steel square or rectangular tube (ST), min sizes as shown in the tables below.

2. **Spray-Applied Fire Resistive Materials* —** Applied by mixing with water and spraying in one or more coats to the thicknesses shown below, to steel surfaces which are clean and free of dirt, loose scale, and oil. Min average and min individual density of 15 and 14 pcf, for Types 300, 300AC, 300HS, 300HS, 300N, 3000, 3000HS and SB. As an alternate to the above table, the required thickness of Spray-Applied Fire Resistive Materials to be applied to all surfaces of the steel columns for all rating periods may be determined from the following equations:

$$h = \frac{R}{75\,(W/D) + 32}$$

(for column W/D range of 0.33 to 2.51)

$$h = \frac{R}{75\,(W/D) + 15}$$

(for column W/D range of 2.51 to 6.68)

Where:
h = Spray-Applied Fire Resistive Materials thickness in the range of 1/4 to 4-1/2 in. (rounded up to the nearest 1/16 in.)
R = Fire resistance rating period in minutes (60=60 mins.)
D = Heated perimeter of the steel column in inches.
W = Weight of the steel column in lbs per foot.

The thicknesses contained in the table below are applicable when the Spray-Applied Fire Resistive Materials applied to the column's flange tips are reduced to one-half that shown in the table below (for contour application):

Column Size lbs.	Min Thkns In. 1 Hr	1-1/2 Hr	2 Hr	3 Hr	4 Hr

The min thickness of Spray-Applied Fire Resistive Materials required for various fire resistance ratings of contour sprayed steel pipes or tubes are shown in the table below:

As an alternate to the table above, the required thickness of Spray-Applied Fire Resistive Materials to be applied to all surfaces of the steel pipes or tubes for all rating periods may be determined from the following equations:

$$h = \frac{R}{188\,(A/P) + 45}$$

Where:
h = Spray-Applied Fire Resistive Material's thickness in the range of 5/16 to 4-1/4 in. (rounded up to the nearest 1/16 in.)
R = Fire resistance rating in minutes (60=60 mins.)
A = Cross-sectional area of pipe or tube.
P = Heated perimeter of steel pipe or tube.

A/P = 0.18 to 0.49

The A/P ratio of a circular pipe is determined by:

$$A/P = \frac{\pi\,(d - t)}{d}$$

Where:
d = the outer diameter of the pipe (in.)
t = the wall thickness of the pipe (in.)

The A/P ratio of a rectangular tube is determined by:

$$A/P = \frac{t\,(a + (w - t))}{a + b}$$

Where:
a = the outer width of the tube (in.)
b = the outer length of the tube (in.)
t = the wall thickness of the tube (in.)
